The POWERBRICK is specifically designed for use inside a broadband network, and also operates as a home or small business alarm server. Each POWERBRICK includes a backup uninterruptible power supply for xDSL, FTTx cable and 3/4G wireless network access equipment such as Modems, Routers, Switches and WiFi Access Points.

The POWERBRICK is ideal for broadband installations and those passive networks where power over cable is not available or possible. The internal battery can provide power to your Modem/Router for 6-24* hours during a power outage. POWERBRICK is fully monitored so if the battery requires replacement, a message can be immediately sent to the owner or service technician who can be automatically dispatched to fit a new one
